

### **OStudio for Java Pro**

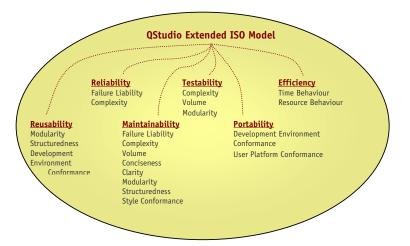

QStudio for Java significantly reduces your code review effort by automating a major portion of your code inspection process; it detects software defects prior to compile time and automatically assesses the quality of your software from within your preferred Java IDE or standalone environment.

QStudio for Java Pro is the standalone version of the QStudio product family. QStudio for Java Pro gives developers the ability to automatically assess and control software quality concepts such as reliability, maintainability and efficiency. Software process managers can tie software development quality control practices deeper and earlier into the software development process than previously possible.

You are looking for ways to improve your software development process. You want to improve time-to-market, software quality and the efficiency of software maintenance. QStudio for Java Pro gives you the benefits of automated software code quality control:

- Reduce time to market by cutting testing time due to earlier detection of (potential) software errors
- Significantly reduce review effort (and therefore cost) by automating a major portion of the inspection process (adherence to coding standards, usage of best programming practices)
- Improve quality control and thereby code quality by directly supporting adherence to improved programming
  practices and corporate coding standards and avoid software quality degradation
- Assess the quality of its existing code base in order, for example, to establish maintenance budgets or for insourcing or outsourcing contracts

### Control conformance to coding standards and the ISO 9126 quality standard

QStudio® enables automated quality control on source code. The corporate code quality goals can be defined in a coding standard using QStudio® rules. The coding standard specifies which rules need to be applied and what their parameterizations are. The developer uses the QStudio® toolset to verify the source code against the conformance to the coding standard and, in the event of identified non-compliances, performs rework (guided by the observations, rule descriptions and patterns that QStudio® provides).

QStudio® specifies quality concepts in a measurable way based on an extended version of the ISO 9126 quality standard. QStudio recognizes quality attributes such as reliability, maintainability, testability, re-usability, portability and efficiency. The model defines a stepwise refinement of the notion of code quality into a set of ISO defined quality attributes and from these a further breakdown into quality sub-attributes. QA Systems proprietary technology maps these attributes in turn onto programming constructs.

### User Definable and User Customizable Rules

QStudio for Java Pro (version 1.9) supports PMD rule specifications (pmd.sourceforge.net) allowing:

- QStudio users to define their own rules via the PMD specification
- QStudio users to tap into the PMD user community and make use of the various rule sets being defined within the PMD community
- PMD users to seamlessly extend their rule sets with the extended ISO 9126 quality model by importing them into QStudio

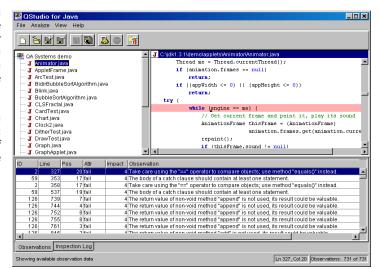

QStudio for Java Pro has advanced rule customizability capabilities including:

- Rule configuration e.g. upper and lower boundary values, selectable scope and field modification and
- Rules instantiation for which a value can be entered at runtime
- Rules for which a regular expression can be entered as value (e.g. for naming conventions)

## **Project and File Level Code Inspection**

Code Inspections can be performed per project, per package (all source files within a package-node) or per source file. During an inspection run the Java source code is checked on all the rules as configured in the checks configuration.

On rule non-compliance detection an observation is generated stating which rule was violated, the reason of the violation and the location where the observation was made.

### **Integrated Development Environments**

Many developers enjoy the advantage of using QStudio for Java seamlessly integrated within their preferred Integrated Development Environment. Software developers will find all the QStudio for Java features at their fingertips: inspecting code, viewing error reports, getting online descriptive pattern based solutions, making code changes and configuring inspection rules. The following IDE's are supported JBuilder™, Oracle® 9i JDeveloper, Eclipse™, WebSphere Studio® and Visual Age®.

QStudio® for Java Pro is available for Windows (98/2000/NT/XP/ME), Linux (RedHat Linux 6.1 and higher, SuSE Linux 7.0 and higher) and Solaris (Solaris 6.1 and higher). QStudio for Java Pro is available for free evaluation or purchase from www.qa-systems.com/pro for just \$295,€295.

# **QStudio for Java Enterprise**

QStudio for Java Enterprise is a web-based collaborative solution that brings developers, quality assurance managers and software development managers together through a distributed software quality control and management system. Besides supporting QStudio for Java Pro functionality, QStudio for Java Enterprise provides advanced enterprise-wide reporting on quality status (ISO 9126 conforming) and quality evolution, trend analysis, coding standards conformance and software metrics. See <a href="https://www.ga-systems.com/enterprise">www.ga-systems.com/enterprise</a> for more information.

QA Systems - The Software Health Company™ - is focused on improving its customers' software health. QA Systems develops software tools to assess, support, monitor and control the health (quality) of software applications developed by its customers both from both a preventative viewpoint (supporting good programming practices) as a diagnostic viewpoint (diagnosing possible software code health risks). See <a href="www.qa-systems.com">www.qa-systems.com</a> or email <a href="mailto:info@ga-systems.com">info@ga-systems.com</a>.
